Query Optimization: Exercise Session 8

Bernhard Radke

October 22, 2018

Generating Permutations

- Keep current prefix and the rest of relations
- Extend the prefix only if exchanging the last two relations does not result in a cheaper sequence

Transformative Approaches

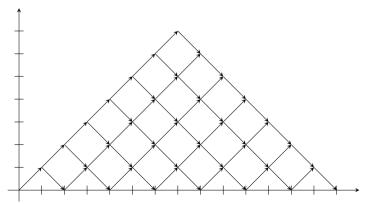

Explore the search space by directly applying equivalences to the initial join tree [?].

Random Trees with Cross Products

- ▶ Generate a tree, then generate a permutation: C(n-1) trees, n! permutations
- ▶ Pick a random number $b \in [0, C(n-1)]$, unrank b
- ▶ Pick a random number $p \in [0, n![$, unrank p
- ► Attach the permutation to the leaves of the tree

```
Unrank(n, r)
Input: the number n of elements to be permuted
        and the rank r of the permutation to be constructed
Output: a permutation \pi
for each 0 < i < n
 \pi[i] = i
for each n \ge i > 0 descending {
 swap(\pi[i-1], \pi[r \mod i])
 r = |r/i|
return \pi:
```

- ightharpoonup every tree is a word in $\{(,)\}$
- map such words to the grid, every step up is (, down)
- ightharpoonup the number of different paths q can be computed (see lectures)
- Procedure: start in (0,0), walk up as long as rank is smaller than q. When it is bigger, step down, rank=rank-q

Next Homework

- unrank permutation/tree
- ▶ implement ExhaustiveTransformation2

- ► Slides and exercises: db.in.tum.de/teaching/ws1718/queryopt
- ▶ Send any questions, comments, solutions to exercises etc. to radke@in.tum.de
- Exercise due: 9 AM. December 18
